## **POROUS NATURAL STONE**

**Permapave Permeable Pavers** can provide a way to overcome negative environmental impact created by impervious surfaces that cause runoff that reduces groundwater, add pollutants to waterways and create water waste. The pavers are made from natural stone yet are 100% porous, offering a flow-through rate of up to 7.5 gal. per second per sq. ft. The pavers offer a practical and economical solution for the elimination of 100% of all gross pollutants, a high percentage of hydrocarbons and stormwater runoff at first flush from waterways. The pavers contain an underlying stone reservoir that stores surface pollution or runoff before draining into the soil. A dedicated stormwater-collection infrastructure is not needed, as they allow water to return directly to underground aquifers. Visit [www.permapave.com](http://www.permapave.com) or **Circle 378**.
